

Multi-Chain Portfolio Explorer

You're building a portfolio explorer. Users connect wallets across multiple blockchain networks, and your job is to present a **clean, unified view of their assets** even when the underlying data is fragmented and inconsistent.

Emails:

- adam.carpenter@ondo.finance

- jay.guyton@ondo.finance

Setup

- Wallet connection can be potentially **mocked** (address + network pairs) but wallet connection would be cool.

Core Requirements

- Combine token balances across wallets and networks into a **single, consistent portfolio view**.
- Normalize tokens so the same asset on different networks is treated as one (e.g. USDC on chain A and chain B). Design how you identify a token — symbol alone isn't enough.
- Display a portfolio view that lets users **group flexibly by token, network, or wallet**.

Product Features

- Grouping: by token (default), network, or wallet. Switching groupings shouldn't require a major refactor.
- Search / filtering.

Stretch (stub if short on time)

- Transaction history is displayed
- Given mocked historical data, show portfolio value over time
- Pagination
- Watch List

UX Expectations

- Handle loading, empty, and partial-failure states (some wallets succeed, some fail).
- Desktop-first is fine.

Working With AI

You may use AI tools freely. Be ready to explain:

- how you used them,
- what you trusted vs. modified,
- where they helped or misled you.
- How to handoff this feature for support by other engineers

Time

~2 hours. Prioritize **clear thinking and structure over polish or completeness.**
